## Plastic Lining

**PFA** *Perfluoroalkoxy* – Excellent suitability for concentrated strong acids at high temperature, aromatics, aliphatic and chlorinated solvents. (White colour)

**ETFE** *Ethylene Tetrafluoroethylene* – Suitable for strong acids, salts in water, solvents at medium temperature. ETFE has the highest abrasion resistance of all the fluorocarbon linings. (Red colour)

**PP** *Polypropylene* – Economic solution for mineral acids, salts in water, de-ionised water and effluent treatment chemicals. (Light grey colour)

**PVDF** *Polyvinylidene Fluoride* – Suitable for mineral acids, salts in water, water and effluent treatment, additionally it is the best solution for wet chlorine gas or chlorine in water. (Black colour)

## Glass Lining

Used in many different applications, including strong acids. Very high corrosion and abrasion resistance within a wide range of temperature. *Note that glass is not suitable for applications where thermal cycling occurs.* (Blue colour)

Corrosion & Chemical Resistance

## Rubber Lining

**HRL** *Hard Natural Rubber* – Used for salts in water, diluted acids, de-ionised water, plating solutions and potable water. HRL has better chemical resistance than SRL. (Black)

**Butyl** *Isobutylene Isoprene* – Great for corrosive & abrasive slurries, and acidic slurries. Additional applications are salts in water, dilute acids and alkalis, and lime. (Black)

**Neoprene** *Polychloroprene* – Perfect solution for a combination of abrasive slurries containing hydrocarbons, sludge oils and also sea water. (Black)

The temperature ranges above are given for general reference purposes only. Service conditions, such as media being handled and concentration of solids, will determine the highest possible working temperature. Additionally, the performance of the valve will also depend on the diaphragm material.

## PTFE Diaphragm

**214/300** - Used in strong acids and alkalis, and salts in water at high temperature. Sulfuric acid is a good example with temperatures up to 110°C and concentrations up to 96 %.

**214/425** - Typical applications are strong acids, alkalis and salts in water at high temperature. Constant steam is also another important application.

**214/226** - Strong acid, diluted chlorine, bromine solutions at low concentration.

**214S/425** - Strong acids, alkalis and salts in water at high temperature. Constant steam applications where the valve is mainly closed (diaphragm is moulded closed).

**214K/425** - Three layer diaphragm with PTFE/PVDF/425, the best option for chlorine, bromine gas and chlorinated solutions.

**425** - Salts in water, acids and alkalis, ozone, water, intermittent steam. Great solution for food and beverages applications. FDA and USP approved<sup>1</sup>.

**300** - Chemicals, diluted acids and alkalis, drinking water. Additional abrasive applications like phosphoric acid in low concentrations. FDA, USP and WRAS approved<sup>1</sup>.

**237** - The best solution for sodium hypochlorite. Great with strong acids and low concentration chlorine gas. It is also oil resistant.

**XA** - Specifically designed for both abrasive and corrosive applications such as phosphoric acid, metal treatment, mining applications.

**HT** - Suitable for abrasive slurries containing hydrocarbons.

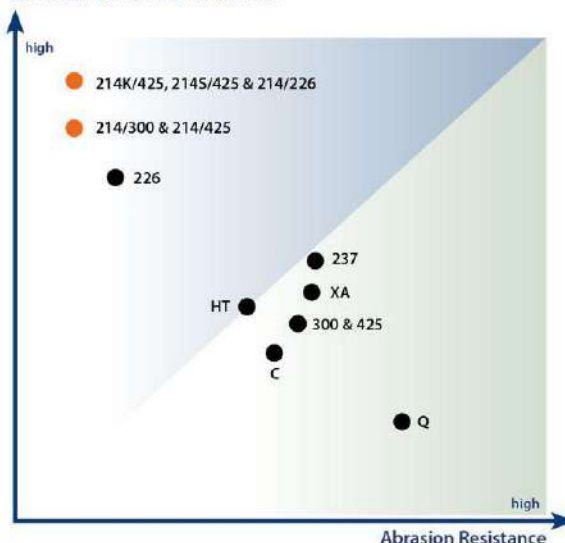

**226** - Great solution for hydrogen at high temperature, concentrated acids, aromatic solvents, low concentrated chlorine solutions, ozone, unleaded petroleum.

**C** - Lubricating oil, cutting oils, paraffin, animal vegetable oils, aviation kerosene at low temperatures. Cv is ideal for vacuum applications, where oils are present, e.g. (compressed air, acetylene gas, LPG).

**Q** - Salts in water, diluted acids and alkalis, and abrasive applications.

## Rubber Diaphragm

Corrosion & Chemical Resistance

<sup>1</sup> FDA - Food and Drug Administration

USP - United States Pharmacopeia

WRAS - Water Regulations Advisory Scheme

All rubber diaphragms have threaded brass fixings, except vacuum diaphragm (Cv, 300v, 425v), which have steel fitments. PTFE diaphragms have a stainless steel bayonet fitments.

Cv = flow in US gal/min through a valve with ΔP = 1 psi

Kv = flow in m³/hr through a valve with ΔP = 1 bar

$$1.156 Kv = Cv$$

Note: All Kv and Cv values shown here refer to flanged valves. Valves with screwed ends demonstrate different Kv/Cv values. For more information contact Saunders®.

<sup>1</sup> Glass lining is typically available in the size range DN15 - DN200 for A Type valves. Contact Saunders<sup>®</sup> for further requirements.

**Cv** = flow in US gal/min through a valve with  $\Delta P = 1$  psi

**Kv** = flow in m<sup>3</sup>/hr through a valve with  $\Delta P = 1$  bar

$$1.156 \text{ Kv} = \text{Cv}$$

Variations in Flow Coefficients (Cv and Kv) ratings can be derived depending on the test method used. The flow coefficient provides a measure of the flow capacity of a valve. It is defined as the volume flow of water at a controlled temperature and a given pressure drop across the valve. This coefficient allows engineers to compare flow capacities of valves of different sizes, types and manufacturers.
